Wizard CaP Flowable Cement is a bone graft substitute uniquely formulated for superior strength and resorption. Calcium phosphate cement (CPC) has been investigated extensively because of its excellent biological properties\(^1\), has been demonstrated to improve functional outcomes in fractures\(^2\), can conform to complex bone cavities\(^3\), and has been used successfully to fill bone defects in tibial plateau fractures\(^4\).

Wizard CaP Flowable Cement is bone void filler made of a proprietary calcium phosphate (CaP) cement formulation that provides osteoconductivity, biocompatibility and uncompromised strength. When implanted in a bony defect, it is resorbed and remodeled by the body as new bone formation occurs. Combining osteoconductivity, biocompatibility and excellent baseline strength, Wizard CaP Flowable Cement quickly repairs damage and becomes a discreet, harmonious part of the subsequent restorative process.

Wizard CaP Flowable Cement is combined with the provided setting solution to form a moldable putty/paste that sets in the body to form a mineral composition similar to bone and has a compressive strength that is greater than human cancellous bone. Thoroughly mixing the CaP powder with the liquid can be completed in less than one minute. Once the paste/putty is formed it may be manually applied to the bony defect or applied to the defect through a cannula. It remains moldable for 3.5 minutes and sets hard within 15 minutes from initial mixing.

**APPLICATIONS:**
- Orthopedic Trauma
- Upper Extremity
- Lower Extremity
- Foot & Ankle
INDICATIONS:
Wizard CaP Flowable Cement is a moldable, self-setting, gradually resorbable calcium phosphate bone void filler. It is intended for use to fill bony voids or defects of the skeletal system (i.e. extremities, pelvis) that may be surgically created or osseous defects created from traumatic injury to the bone and is only for bone voids or defects that are not intrinsic to the stability of the bony structure. Wizard CaP Flowable Cement may be manually applied to the bony defect or applied to the defect through a cannula. Wizard CaP Flowable Cement is resorbed and remodeled by the body as new bone formation occurs during the healing process.
